Five moves for teaching with AI.

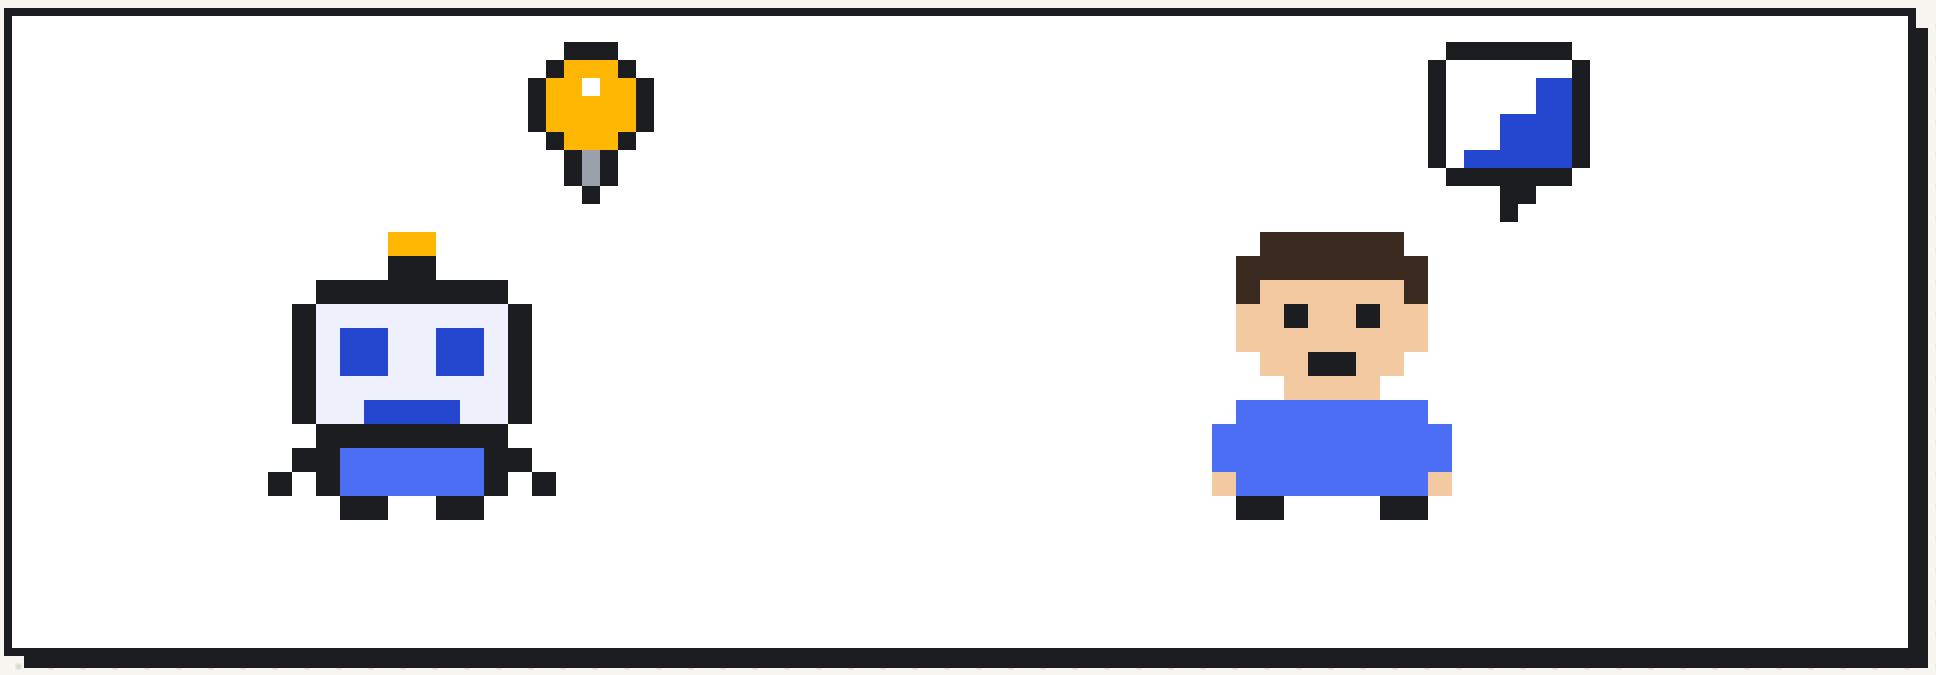

AI in a course can lower exam scores or double learning gains.

The difference is design, not the model.

MOVE 1 OF 5

Hints, not answers.

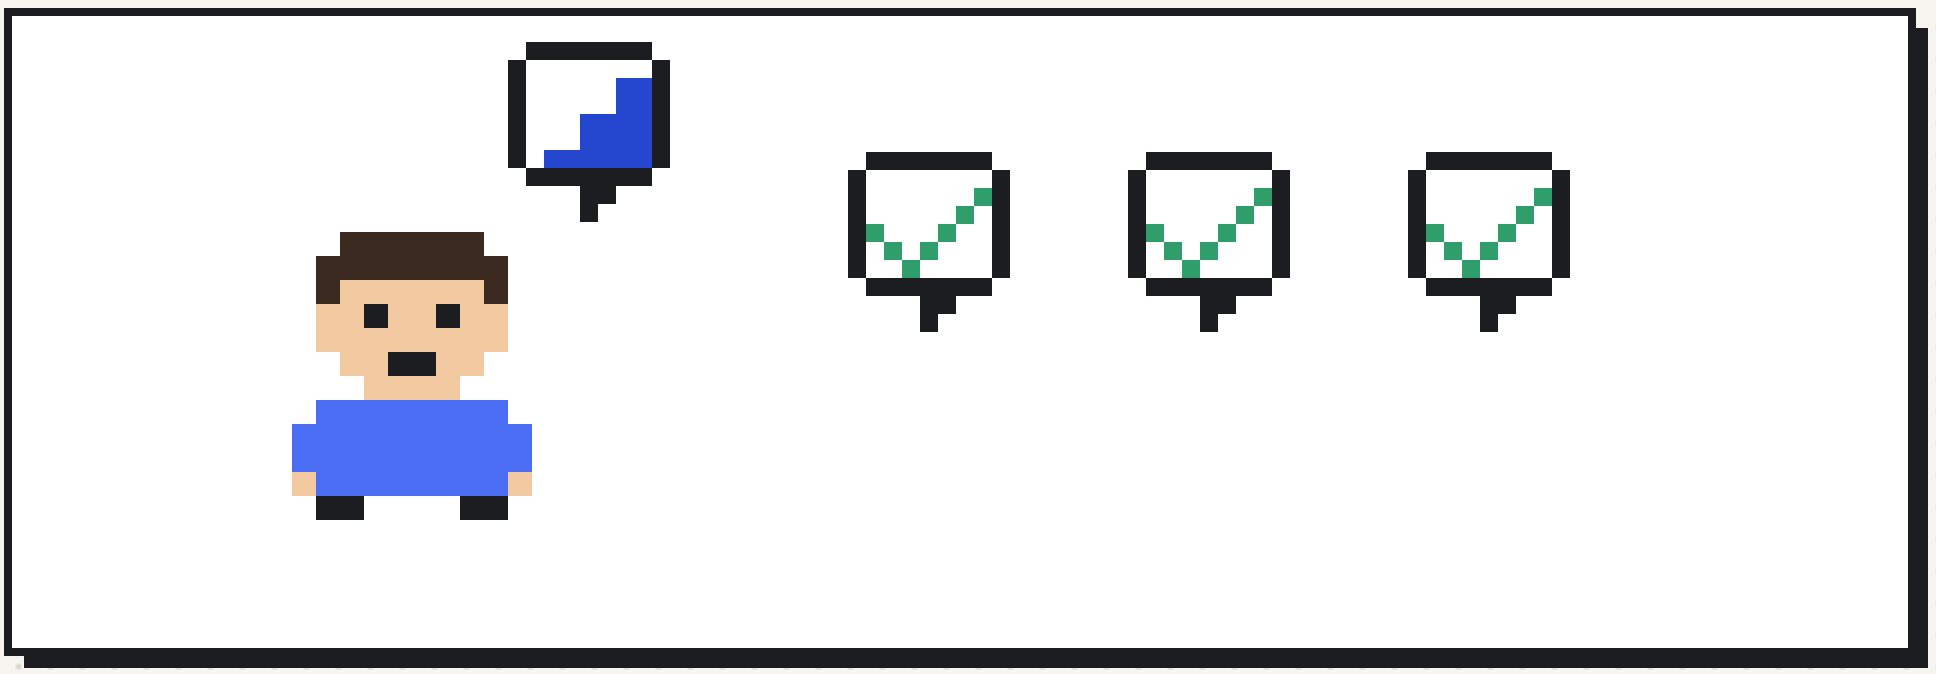

ChatGPT-style help: 17% lower on the exam.
Guardrailed tutor: that drop essentially disappeared.

Bastani et al., PNAS 2025

MOVE 2 OF 5

Sequence the work.

Harvard's instructor-built tutor went one step at a time. Median learning gains more than doubled over an in-class active-learning lesson.

Kestin et al., Scientific Reports 2025

MOVE 3 OF 5

Assess without AI at least once.

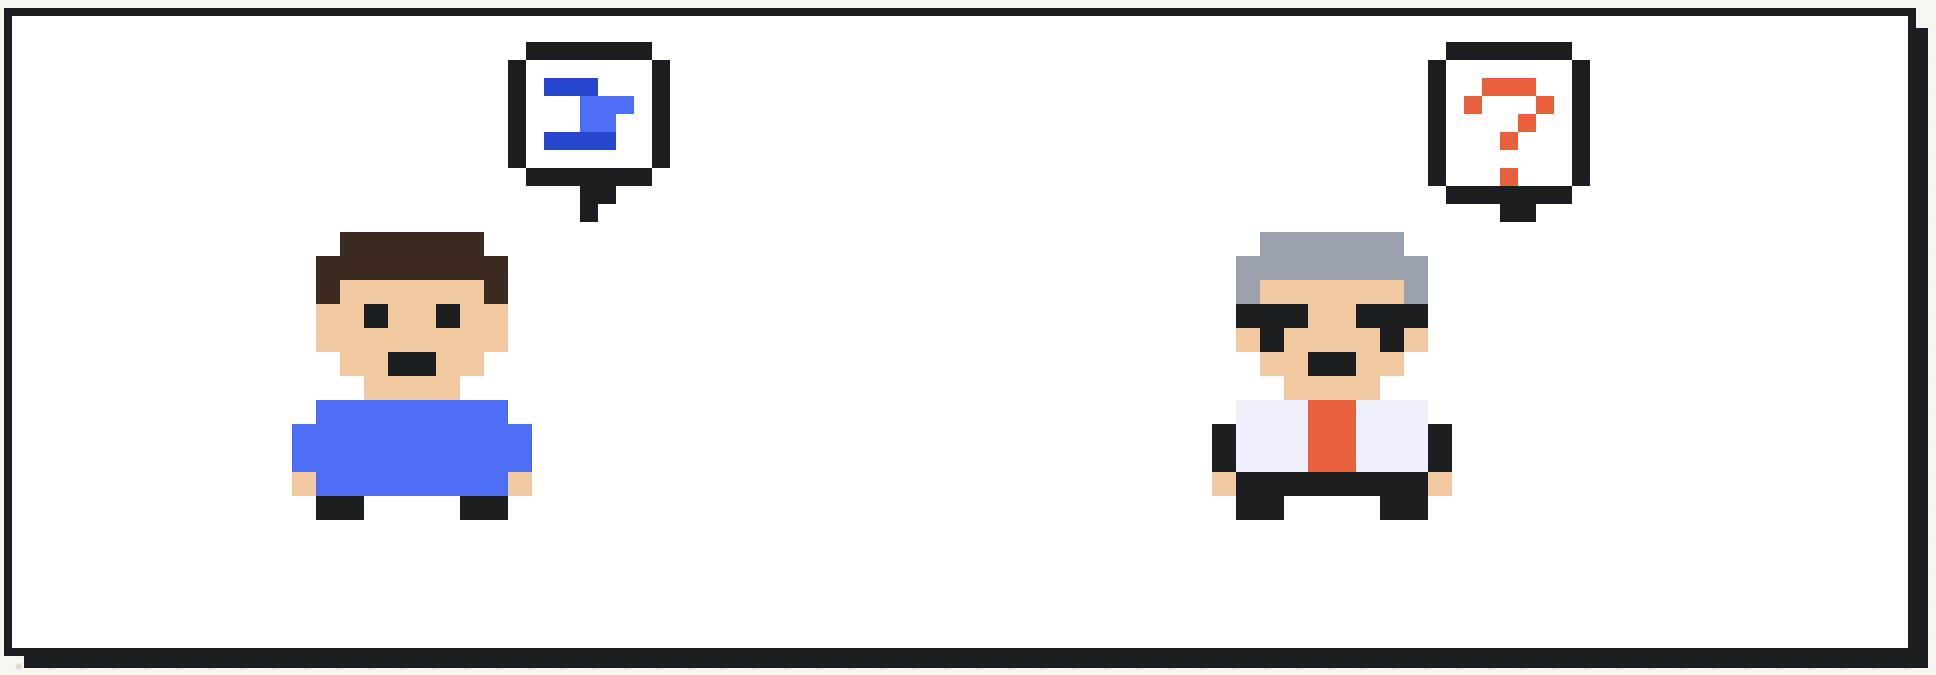

Scores with AI show performance.
Scores without it show what stuck.

Design recommendation drawn from Bastani et al., PNAS 2025

MOVE 4 OF 5

Grade the explanation, not the artifact.

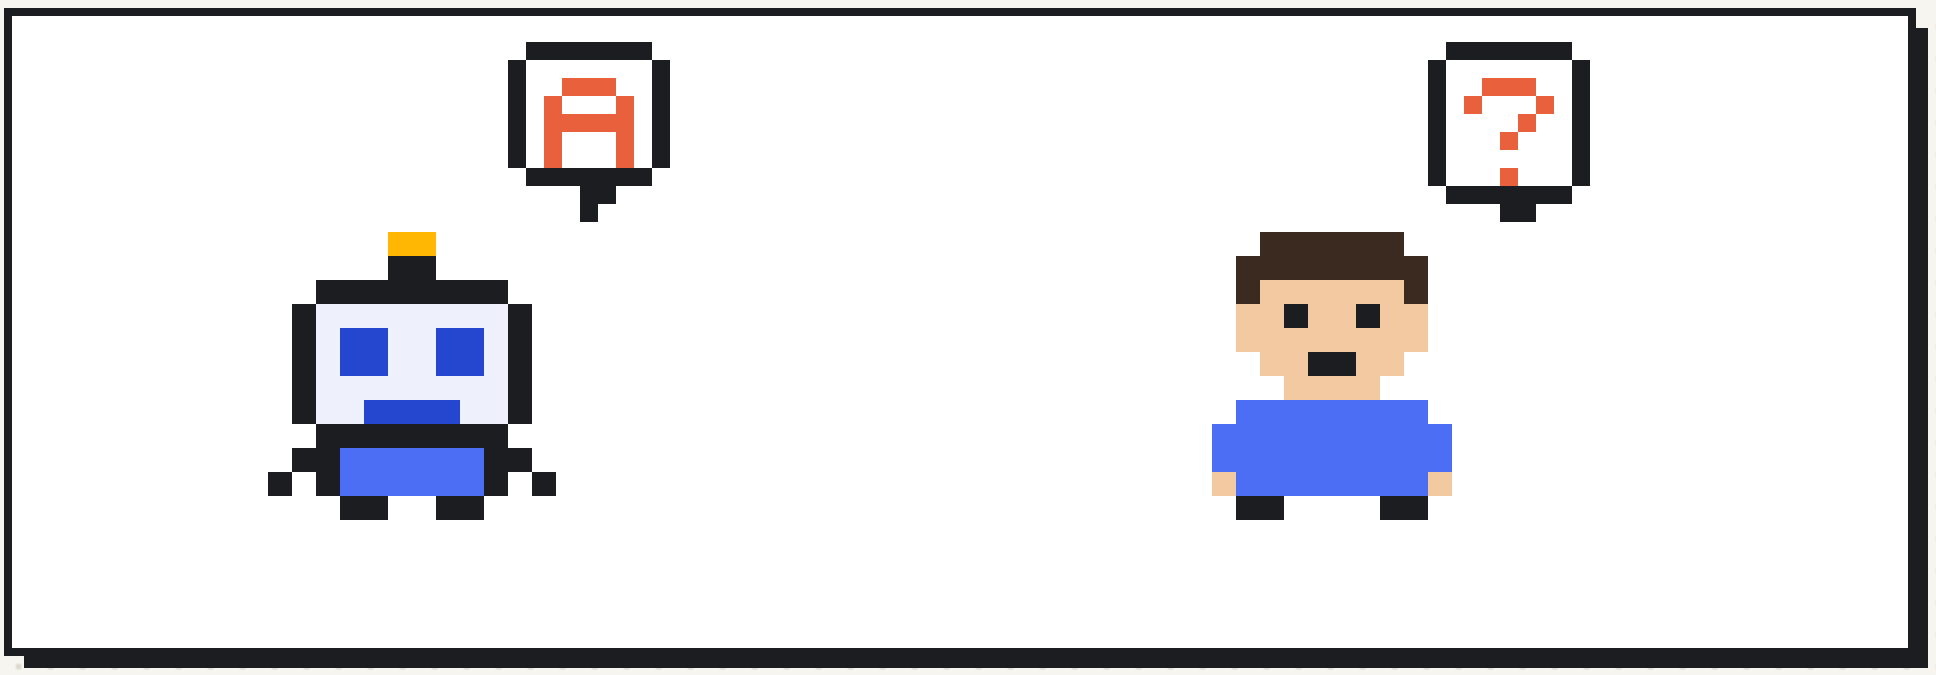

One intro CS course added weekly oral code reviews. AI use rose. Exam averages held steady.

Fowles et al., 2026 (preprint, one course)

MOVE 5 OF 5

Teach verification as a skill.

Verifying AI-generated work is gaining ground as implementation-level coding loses it.

Lee et al., 2026 (report from 23 computing educators)

Only 5%

of students with AI in their courses say it transformed how they learn.

Adding AI isn't redesigning.

Which of the five would be hardest at your institution?

Digital Education Council, Global Survey 2026
